

6.1 Radian Measure

<p><b>A Angles</b></p> <p>Angle is the region between <i>two rays</i> (called <i>arms</i>) starting from the same end-point called the <i>vertex</i> of the angle.</p> <p>One line split the plan in two angles called <i>straight</i> angles.</p> <p>Two perpendicular lines split the plan in four angles called <i>right</i> angles.</p> <p>Any angle less than a right angle is called <i>acute</i> angle.</p> <p>Any angle greater than a right angle and less than a straight angle is called <i>obtuse</i> angle.</p> <p>An angle that is greater than a straight angle is called <i>reflex</i> angle.</p> <p>If the arms are coincident then a <i>full turn</i> angle is formed.</p>	
<p><b>B Sign</b></p> <p>If the rotation of the initial arm toward the terminal arm is a <i>counter clockwise</i> rotation the angle is considered <i>positive</i>.</p> <p>Otherwise the angle is <i>negative</i>.</p>	
<p><b>C Standard Position</b></p> <p>If the <i>initial arm</i> is <i>parallel to the x-axis</i> then the angle is in standard position.</p>	<p><b>D Degrees</b></p> <p>The measurement of a <i>right angle</i> in degrees is (by convention) <math>90^\circ</math>.</p>
<p>Ex 1. Find the measurement of each angle (given in standard position) in degrees.</p> <div style="display: flex; flex-wrap: wrap; justify-content: space-around;"> <div style="text-align: center;">a) </div> <div style="text-align: center;">b) </div> <div style="text-align: center;">c) </div> <div style="text-align: center;">d) </div> <div style="text-align: center;">e) </div> <div style="text-align: center;">f) </div> <div style="text-align: center;">g) </div> <div style="text-align: center;">h) </div> <div style="text-align: center;">i) </div> <div style="text-align: center;">j) </div> <div style="text-align: center;">k) </div> <div style="text-align: center;">l) </div> </div>	

**E Radians**

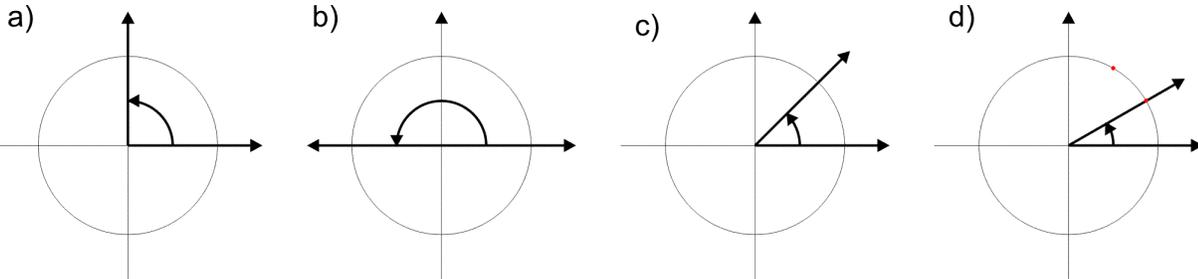

Angles can be measured also in *radians*.  
 The measure of an angle in radians is given by the ratio between the *arc length* subtended by the angle and the *radius length* of that circle:

$$\alpha = \frac{s}{R}$$

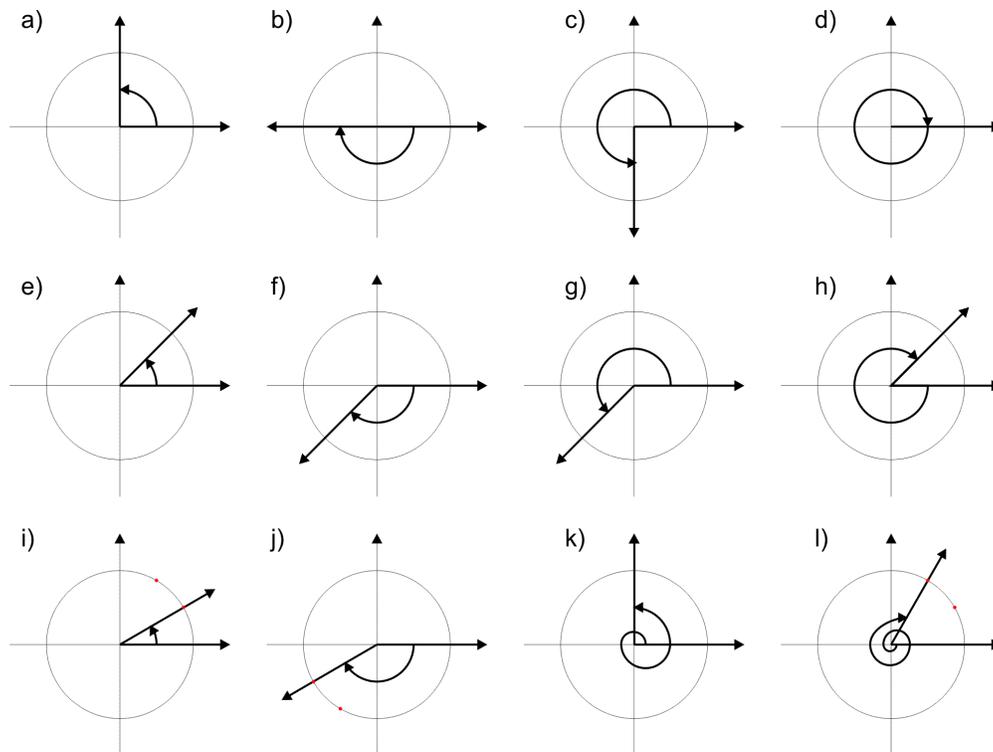

Note. To calculate the angles in radians recall the *circumference* length formula:

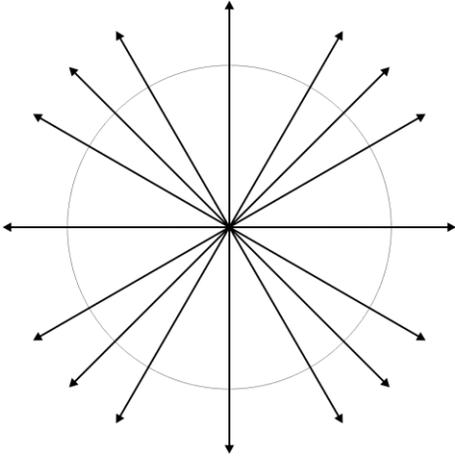

$$C = 2\pi R$$

Ex 2. Use the definition to find the measurement of each angle in radians.

Ex 3. Find the measurement of each angle in radians.

<p><b>D Conversion formula</b></p> <p>The <i>conversion</i> between degree and radian measure is based on the equality:</p> $180^\circ = \pi \text{ radians}$	<p>which is equivalent to:</p> $1^\circ = \frac{\pi \text{ radians}}{180} \quad \text{or}$ $1 \text{ radian} = \frac{180^\circ}{\pi}$
<p>Ex 4. Do the required conversions.</p> <p>a) <math>10^\circ = ? \text{ radians}</math></p> <p>b) <math>-1^\circ = ? \text{ radians}</math></p>	<p>c) <math>\sqrt{2} \text{ radians} = ?^\circ</math></p> <p>d) <math>-0.1 \text{ radians} = ?^\circ</math></p>
<p>Ex 5. Complete the diagram with the angles expressed in degrees and radians.</p>	
<p><b>E Arc Length</b></p> <p>The arc length subtended by the angle <math>\theta</math> (in radians) on a circle of radius <math>R</math> is given by:</p> $s = \theta R$	<p>Ex 6. Find the length of the arc subtended by an angle of <math>50^\circ</math> on a circle of radius <math>30\text{cm}</math>.</p>
<p><b>F Sector Area</b></p> <p>The sector area delimited by an angle <math>\theta</math> (in radians) and a circle of radius <math>R</math> is given by:</p> $A = \frac{1}{2} \theta R^2$	<p>Ex 7. Find the area delimited by an angle of <math>120^\circ</math> and a circle of radius <math>10\text{cm}</math>.</p>
